## 7. Multi-Attribute Decision Making

Many decisions are based on other attributes than price. Choosing a car, for instance, although you might be looking in a particular price band. Comfort, performance, reliability, size, safety, status, image - these are some attributes of cars.
Example: helping a family to buy a car
Steps: (1) Clarify problem; (2) Identify objectives; (3) Measurement of effectiveness.
(1) keep an older car?

Clarify use public transport?
problem constraints? -
\$
manual transmission / auto?
size?
power steering?
? 1. driving kids to school
? 2. reliable \& safe commuting vehicle?
?3. status symbol
?4. help on family holidays

Example(cont.):

## Additive Valuation

1. Use scales for $S_{1}, S_{2}, S_{3}$
(1) (2) (3)

For each of the three attributes (1), (2), and (3), rank the cars from 0 to 1 .
2. Subject to the $\$$ constraint, now weight the three attributes: that is,

- how important is the first attribute (comfort) in the total decision? $\rightarrow \mathrm{w}_{1}$
- How important the second (safety and reliability)? $\rightarrow \mathrm{w}_{2}$
- The third (status)? $\rightarrow \mathrm{w}_{3}$

The three weightings $\mathrm{w}_{1}, \mathrm{w}_{2}, \mathrm{w}_{3}$ should be normalised: $\Sigma \mathrm{w}_{\mathrm{i}}=1$.
3. From the rankings, each car j has a score for attribute i :
$\mathrm{x}_{\mathrm{ij}}$ : score of car j in attribute i
E ach car's total score can thus be calculated: $\sum_{\mathrm{i}} \mathrm{x}_{\mathrm{ij}} \mathrm{w}_{\mathrm{i}} \rightarrow$ score for car j
4. Choose the car with the highest score, or iterate, until you feel happy with the scores, the weightings, and the final outcome.

## Multiattribute Problem

CBA a subset
e.g. which bank ?

$$
\begin{array}{c|c|c}
\begin{array}{c|c}
\text { quality of } \\
\text { service }
\end{array} & \begin{array}{c}
\text { interest } \\
\text { rates }
\end{array} & \text { location } \\
\text { Comparing specific } & \text { outcomes } \\
\hline
\end{array}
$$

There are six ways:

> (Perry \& Dillon in Package)

1. Pairwise comparisons
2. "Satisficing"
3. Lexicographic ordering
4. Reducing search
5. Even swaps, or Pricing out
6. Additive value models

### 7.1 Pairwise comparisons

"eye-balling":
$>$ OK for small number of attributes
$>$ ? OK number of alternatives?
$>$ large number of alternatives or attributes
$>$ no complete preference ordering
$>$
but - time consuming, costly

- continuous variables
$\rightarrow$ no information for delegation

## 7.2 "Satisficing"

> set minimum levels ("satisfy") of all attributes but one (the "target" attribute)
$>$ choose the project/outcome/action with the highest level of the target
$\rightarrow$ iterative solution
if min levels too $\begin{gathered}\text { high } \\ \text { low }\end{gathered}$
So: useful, often used, attributes explicit

### 7.3 Lexicographic Ordering

How to:
> rank attributes;
$>$ choose project with the highest Attribute 1;
$>$ only consider Attribute 2 if there is a tie in terms of Attribute 1.
$>$ Using the letters of the alphabet in order, this is how dictionaries (or lexicons) order words - hence, lexicographic.
$>$ Examine the table on the next page, where countries' performances at the Atlanta Olympics are tabulated lexicographically.
This means there is no trade-off between numbers of Silver medals and numbers of Golds, so that Denmark (4 G, $1 \mathrm{~S}, 1 \mathrm{~B}$ ) is ranked nineteenth, while Great Britain ( $1 \mathrm{G}, 8 \mathrm{~S}, 5 \mathrm{~B}$ ) is ranked thirty-sixth.

- Or we could rank by total number of medals, which means equal trade-offs between Gold and Silver and Bronze.
> Or we could weight the medals, say, Gold $=3$, Silver $=2$, Bronze $=1$, which still allows a trade-off, but not an equal trade-off.

Lexicographically Ranked by Gold, Silver, Bronze Medals (Atlanta)

|  | Gold | Silver | Bronze | Total |
| :---: | :---: | :---: | :---: | :---: |
| United States | 44 | 32 | 25 | 101 |
| Russia | 26 | 21 | 16 | 63 |
| Germany | 20 | 18 | 27 | 65 |
| China | 16 | 22 | 12 | 50 |
| France | 15 | 7 | 15 | 37 |
| Italy | 13 | 10 | 12 | 35 |
| Australia | 9 | 9 | 23 | 41 |
| Cuba | 9 | 8 | 8 | 25 |
| Ukraine | 9 | 2 | 12 | 23 |
| South Korea | 7 | 15 | 5 | 27 |
| Poland | 7 | 5 | 5 | 17 |
| Hungary | 7 | 4 | 10 | 21 |
| Spain | 5 | 6 | 6 | 17 |
| Romania | 4 | 7 | 9 | 20 |
| Netherlands | 4 | 5 | 10 | 19 |
| Greece | 4 | 4 | 0 | 8 |
| Czech Republic | 4 | 3 | 4 | 11 |
| Switzerland | 4 | 3 | 0 | 7 |
| Denmark | 4 | 1 | 1 | 6 |
| Turkey | 4 | 1 | 1 | 6 |
| Canada | 3 | 11 | 8 | 22 |
| Bulgaria | 3 | 7 | 5 | 15 |
| J apan | 3 | 6 | 5 | 14 |
| Kazakhstan | 3 | 4 | 4 | 11 |
| Brazil | 3 | 3 | 9 | 15 |
| New Zealand | 3 | 2 | 1 | 6 |
| South Africa | 3 | 1 | 1 | 5 |
| I reland | 3 | 0 | 1 | 4 |
| Sweden | 2 | 4 | 2 | 8 |
| Norway | 2 | 2 | 3 | 7 |
| Belgium | 2 | 2 | 2 | 6 |
| Nigeria | 2 | 1 | 3 | 6 |
| North K orea | 2 | 1 | 2 | 5 |
| Algeria | 2 | 0 | 1 | 3 |
| Ethiopia | 2 | 0 | 1 | 3 |
| Great Britain | 1 | 8 | 5 | 15 |
| Belarus | 1 | 6 | 8 | 15 |
| Kenya | 1 | 4 | 3 | 8 |
| J amaica | 1 | 3 | 2 | 6 |
| Finland | 1 | 2 | 1 | 4 |
| Indonesia | 1 | 1 | 2 | 4 |
| Yugoslavia | 1 | 1 | 2 | 4 |
| Iran | 1 | 1 | 1 | 3 |

| Slovakia | 1 | 1 | 1 | 3 |
| :--- | :--- | :--- | :--- | :--- |
| Armenia | 1 | 1 | 0 | 2 |
| Croatia | 1 | 1 | 0 | 2 |
| Portugal | 1 | 0 | 1 | 2 |
| Thailand | 1 | 0 | 1 | 2 |
| Burundi | 1 | 0 | 0 | 1 |
| Costa Rica | 1 | 0 | 0 | 1 |
| Ecuador | 1 | 0 | 0 | 1 |
| Hong Kong | 1 | 0 | 0 | 1 |
| Syria | 1 | 0 | 0 | 1 |
| Argentina | 0 | 2 | 1 | 3 |
| Namibia | 0 | 2 | 0 | 2 |
| Slovenia | 0 | 2 | 0 | 2 |

### 7.4 Reducing Search

e.g. which building to choose, given the two main uses for the building of Athletics and Crafts?

|  | Rank (ordinal) |  |
| :---: | :---: | :---: |
| Building | Athletics | Crafts |
| A | 4 | 4 |
| B | 1 | 2 |
| C | 3 | 5 |
| D | 2 | 1 |
| E | 5 | 3 |

### 7.5 Even Swaps, or Pricing Out

[see the Hammond HBR reading.]
e.g. which of five jobs to choose, given the five attributes of each job?

Attributes / Characteristics

|  | J ob | Salary | Leisure <br> Time | Working <br> conditions | Co- <br> workers |
| :---: | :---: | :---: | :---: | :---: | :---: | Where

Freda has ranked the jobs in terms of each attribute.

| E | $\mathcal{P}$ | A |
| :--- | :--- | :--- |
| E | $\mathcal{P}$ |  |
| D | $\mathcal{C}$ | B |$\quad \therefore$ Freda's comparison is reduced to D, E

## Even Swaps (cont.)

Spell out the measures of each attribute:

|  | Salary | Leisure | Working Conditions | Colleagues | Location |
| :--- | ---: | :---: | :---: | :---: | :---: |
| D | $\$ 90 \mathrm{k}$ | 8 days | $\mathrm{W}_{\mathrm{D}}$ | $\mathrm{C}_{\mathrm{D}}$ | $\mathrm{L}_{\mathrm{D}}$ |
| E | $\$ 100 \mathrm{k}$ | 5 days | $\mathrm{W}_{\mathrm{E}}$ | $\mathrm{C}_{\mathrm{E}}$ | $\mathrm{L}_{\mathrm{E}}$ |

Q: How much of $\$ 100 \mathrm{~K}$ would Freda be prepared to give up to get 3 additional leisure days/year?
A: $\$ 25 \mathrm{~K} \rightarrow \mathrm{E}^{\prime}$

$$
\begin{array}{l|lllll}
\mathrm{D} & 90 \mathrm{k} & 8 & \mathrm{~W}_{\mathrm{D}} & \mathrm{C}_{\mathrm{D}} & \mathrm{~L}_{\mathrm{D}} \\
\mathrm{E}^{\prime} & 75 \mathrm{k} & 8 & \mathrm{~W}_{\mathrm{E}} & \mathrm{C}_{\mathrm{E}} & \mathrm{~L}_{\mathrm{E}}
\end{array}
$$

from above $W_{\mathrm{E}}$ (1st) $>\mathrm{W}_{\mathrm{D}}$ (2nd)

Q: How much of $\$ 90 \mathrm{k}$ would Freda be prepared to give up to get $\mathrm{W}_{\mathrm{E}}$ ?
A: \$10k $\rightarrow D^{\prime}$
"pricing out"

## Even Swaps (cont.)

| $\mathrm{D}^{\prime}$ | \$80k | 8 | $\mathrm{W}_{\mathrm{E}}$ | $C_{\text {D }}$ | $L_{\text {D }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{E}^{\prime}$ | \$75k | 8 | $W_{\text {E }}$ | $\mathrm{C}_{\mathrm{E}}$ | $\mathrm{L}_{\mathrm{E}}$ |
| $\mathrm{D}^{\prime}$ | \$80k | 8 | $\mathrm{W}_{\mathrm{E}}$ | $C_{\text {D }}$ | $L_{\text {D }}$ |
| E" | \$70k | 8 | $\mathrm{W}_{\mathrm{E}}$ | $C_{D}$ | $\mathrm{L}_{\mathrm{E}}$ |
| D" | \$72.5k | 8 | $W_{\text {E }}$ | $C_{\text {D }}$ | $L_{E}$ |
| E" | \$70k | 8 | $\mathrm{W}_{\mathrm{E}}$ | $C_{\text {D }}$ | $\mathrm{L}_{\mathrm{E}}$ |

i.e. all attributes "priced out" by Freda, whose choice is job D

$$
\begin{gathered}
\mathrm{D}^{\prime} I \mathrm{D}^{\prime \prime}-? \\
\mathrm{E}^{\prime} I \mathrm{~B}^{\prime \prime}-? \\
\mathrm{D} I \mathrm{D}^{\prime}-? \\
\mathrm{E}_{I} \mathrm{~B}^{\prime}-? \\
\mathrm{E}^{\prime \prime} I \mathrm{D}^{\prime \prime} \\
\therefore \mathrm{E}_{I} \mathrm{D} \\
\mathrm{D} I_{I} \mathrm{D}^{\prime \prime} \mathscr{P} \mathrm{E}^{\prime \prime} I \mathrm{E} \Rightarrow \mathrm{D} \mathscr{P} \mathrm{E}
\end{gathered}
$$

Pitfalls $\rightarrow$ Majone (ed.)

1. decision-maker's errors
misunderstanding the concepts, questions expressing preferences etc.
2. analyst's errors
testing for preference independence (see below)

- 
- 

3. attitudes might change (subjective)
4. situation might change (objective)

| Olympics | Gold | Silver | Bronze | Total |
| :--- | :---: | :---: | :---: | :---: |
| USA | 43 | 20 | 18 | 81 |
| USSR (URS) | 40 | 31 | 23 | 94 |
| EG (GDR) | 35 | 49 | 9 | 93 |
| FRA | 15 | 6 | 14 | 35 |
| AUS | 1 | 10 | 8 | 19 |
| NZ | 1 | 9 | 12 | 22 |

|  | Goals |  | Behinds |  | Points |
| :--- | ---: | :--- | :---: | :---: | :---: |
| Hawthorn | 11 | $:$ | 11 | $:$ | 77 |
| Melbourne | 6 | $:$ | 5 | $:$ | 41 |
|  |  |  |  |  |  |
| $\mathrm{P}=6 \mathrm{G}+\mathrm{B}$ |  |  |  |  |  |

### 7.6 Additive Value Models

e.g. three projects: $A, B, \& C R$
three attributes:

| Net Present Value | PV | $\oplus$ | the more the better |
| :--- | :---: | :---: | :--- |
| Time to Completion | T | $\ominus$ | the less the better |
| Size | S | $\oplus$ |  |

- Independence o

If the trade-off between $\{P V \& T\}$ is independent of the level of $S$
\& if the trade off between $\{T, S\}$ is independent of the level of PV then $\{P V \& S\}$ are independent of $T$.
i.e. Preference Independence of PV, T, S

## Value Function

$$
\mathrm{V}(\text { project } \mathrm{j})=\sum_{\mathrm{i}}^{\text {attributes }} \mathrm{w}_{\mathrm{i}}\left[\mathrm{v}_{\mathrm{ij}}\left(\mathrm{x}_{\mathrm{ij}}\right)\right]
$$

$>$ where $\mathrm{x}_{\mathrm{ij}}$ is the level of attribute i in project j
$>$ where $\mathrm{v}_{\mathrm{ij}}($.$) is a "relative value preference of attribute \mathrm{i}$ for project j " $v_{\mathrm{ij}} \in[0,1]$
$>$ where $\mathrm{w}_{\mathrm{i}}$ are attribute weights, $\Sigma \mathrm{w}_{\mathrm{i}}=1$
Project $\mathrm{j} \rightarrow$ score $\mathrm{V}_{\mathrm{j}}$ \& can compare projects : $\mathrm{V}_{\mathrm{j}}$ to obtain ranking

| e.g. | $\mathrm{w}_{\mathrm{i}}$ | A ${ }_{\mathrm{j}}$ |  |  |  | $\text { C } \underset{j=3}{v_{i 3}}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NPV | 0.9 | \$20m | 0.5 | \$15m | 0 | \$25m | 1 |  |
| T | 0.06 | 8 y | 0.6 | $5 y$ | 1 | 12y |  |  |
| S | 0.04 | 200k | 0.8 | 300k | 1 | 100k | 0 |  |

e.g. $x_{23}=$ level of attribute $T$ in Project $3=12$.
$\Sigma \mathrm{w}_{\mathrm{i}}=1, \mathrm{w}_{\mathrm{i}} \geq 0$ attribute weights

$$
\begin{aligned}
\operatorname{project} \mathrm{A}: & \mathrm{V}_{\mathrm{A}} \\
& =0.9 \times 0.5+0.06 \times 0.6+0.04 \times 0.8=0.518 \\
\rightarrow \quad & \mathrm{~V}_{\mathrm{B}}
\end{aligned}=0.9 \times 0+0.06+0.04=0.1 \mathrm{O}=1+0+0=0.9 \mathrm{l}
$$

## Alternatives

|  | J ob A | J ob B | J ob C | J ob D | J ob E |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Objectives |  |  |  |  |  |
| Monthly |  |  |  |  |  |
| Flexibility | mod | low | high | mod | none |
| Business skills | computer | people man. | operations | org. | time man. |
| Development computer computer multitasking |  |  |  |  |  |
| Annual leave | 14 | 12 | 10 | 15 | 12 |
| Benefits | health, dental retirement | health, dental | health retirement | health | health, dental |
| Employment | great | good | good | great | boring |

## 8. Landsburg

1. Tax revenues are not a net benefits (when looking from society's viewpoint) and a reduction in tax revenues is not a net cost.
2. A cost is a cost, no matter who bears it.
3. A good is a good, no matter who owns it.
4. Voluntary consumption is a good thing.
5. Don't double count.

Only individuals matter
$+$
All individuals matter equally (or: a \$ is a \$, no matter whose)

## 9. Real Options

(See Dixit \& Pindyck and Bruun \& Bason — handouts)
Disadvantages of NPV/DCF (especially for private firms):

1. positive-NPV opportunities might be bid away as firms enter (strategic rivalry)
2. allocation of overhead costs in a multi-project setting is non-trivial
3. assumption of reinvetment at the entire project's rate is questionable
4. the risk adjustment ( $\beta$ ) of the discount rate depends on: project life, growth trend in the expected DCF, etc.
5. interdependencies among projects: spillovers, asymmetric (skewed) outcomes, etc.
6. investments are sunk (sometimes assumed not)
7. the Winner's Curse when choosing one of several:
the estimates of future costs and benefits are not unbiassed in the most attractive project (highest benefits - costs): possibility of negative NPV.

## What if there are options present:

- timing: wait
- operational: flexibility \& discretion once underway
- growth: future options contingent on this project

Then NPV/DCF:

1. with timing options:
if projects are exclusive or investment budgets limited, then projects effectively compete with themselves over time.
2. with operational options:
including

- temporary shutdowns
- expanding or scaling down operations
- switching between inputs, outputs, or processes

Can create value, but skew the return distribution: must use options techniques.
3. with growth options:
or follow-on investments, with distant and uncertain payoffs. Often, learning more about future options is most valuable.

## Why not use Decision Analysis?

Plus: an Influence Diagram or Decision Tree does model asymmetries and paths, but
Minus: as the value of the underlying asset (the project) changes over time, so does its risk and so the correct risk premium.

Answer: the principles of risk-neutral valuation with the Black-Scholes option pricing techniques.
